

Monitoring of new domain names registrations

Every day new domain names are registered all over the world. **Keys to your digital territory**, they are a prime target for cybercriminals.

To protect your brand on the Internet from the **risks of phishing, parasitism, cybersquatting, typosquatting** and others, it is necessary to monitor new domain names registrations that could potentially affect your notoriety, your activity, and your results.

For this purpose, Nameshield provides you with an **automated permanent monitoring**.

Efficient and reactive global research

Every day we get the list of domain names registered with the main registries.

We search for registrations using your brand identically or similarly, in Latin or non-Latin characters.

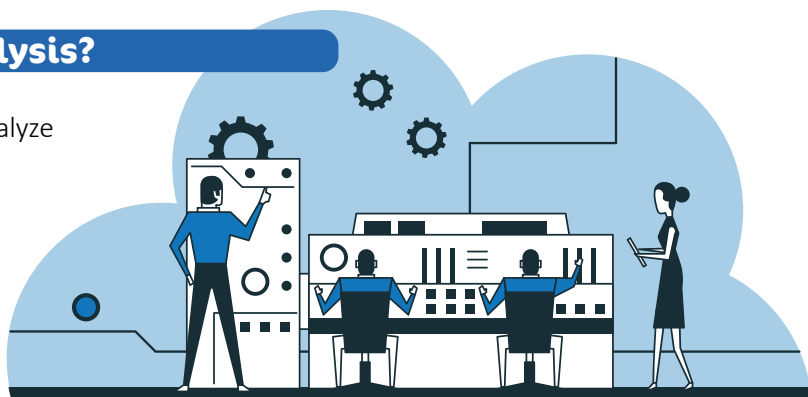

We identify the holders to allow you to launch the appropriate actions such as UDRP procedures, transfers, acquisitions...

We also analyze registered names zones to detect potential MX records, which may indicate an upcoming phishing attempt.

Need an expert analysis?

We propose a package in which our experts analyze the raw results.

You receive reports which only contain results representing a risk, associated to actions recommendations.

Personalized monitoring

Choose the right option:

gTLDs monitoring

Focused on generic domain names registrations (gTLDs and new gTLDs), this monitoring is based on daily registrations with the registries.

gTLDs and ccTLDs monitoring

This option resumes the previous one and extends the monitoring to ccTLDs: we check if generic domain names have been registered in country code extensions.

Research modes adapted to your needs:

Identical: Search for an exact match regardless of its position in the domain name.

Approaching: Search for phonetic and typographical similarities (addition, deletion, inversion, substitution of character).

Personalized request: We propose Boolean operators and truncation operators to finely configure the variations of the searched terms.

Reports

Sent by e-mail, they are generated in PDF and Excel format and can be sent to several recipients.

They contain the list of registered domain names corresponding to the searched terms. The domain names are accompanied by whois information.

The PDF format is suitable for distribution and sharing within the company. It is also possible to launch actions directly from the reports. The Excel format, on the other hand, allows for faster consultation of information and offers the possibility of manipulating data.

A history of the reports is kept and can be consulted on our platform.

You choose the frequency of sending reports, weekly or daily.

Benefit from our experience in protection

With nearly 30 years of experience at the service of its customers and partners, Nameshield is the French provider of reference for domain names management, security and associated services. Recognized by its peers, Nameshield evolves in the heart of the cybersecurity ecosystem and anticipates the current and future challenges of companies and administrations.
